Hello, and welcome to my portfolio. I am a software engineer with a degree in Computer Science and Applied Mathematics from NJIT. I'm passionate about building full-stack and cloud-based applications that solve real problems, scale reliably, and deliver meaningful user experiences. Through my projects and coursework, I've developed a solid foundation in software engineering, backend development, and cloud architecture. I work comfortably across the stack using technologies such as React, FastAPI, Flask, PostgreSQL, DynamoDB, and AWS serverless services, including Lambda, API Gateway, S3, and EventBridge.

One of my most impactful projects, Stardewdle, is a Wordle-style daily puzzle game powered by a fully serverless AWS backend. It uses Node.js with AWS Lambda, DynamoDB, and EventBridge to automate daily puzzle rotations. The platform has supported over 3,000 daily players and over 400,000 total plays, and has been maintained and iterated on for more than 12 months, shipping feature updates, bug fixes, and performance improvements. The stack was also modernized by migrating asset delivery to Cloudflare R2, implementing global CDN caching and HSTS security policies to optimize performance, reducing edge load by 95%. This project has not only strengthened my ability to design highly available, low-latency systems but also demonstrated my commitment to iterative development and operational cost-optimization in a real-world environment.

Another major project, Teacher's Pet, highlights my full-stack and systems-level thinking. I developed a platform for generating reproducible math worksheets using seed-based randomization. The backend, built with FastAPI and PostgreSQL, handles problem generation, PDF creation, and template management with search and tagging. The Next.js frontend provides a customizable interface for users creating multi-section worksheets. I also implemented CI/CD pipelines, using both Vercel and Railway, giving me practical experience with modern deployment workflows.

I also worked on ChefAsap, a React Native mobile application that connects customers with local chefs for menu ordering and in-person cooking sessions. I engineered features such as real-time chat, Stripe payments, menu and scheduling tools for chefs, and booking management powered by a Flask and PostgreSQL backend. This project deepened my experience with mobile UI design, authentication, and real-time communication.

Beyond my technical work, I've spent the past several years as a math and computer science tutor at MenteeGo Education, where I develop personalized learning plans and explain complex concepts to a wide range of students. This experience has strengthened skills that are invaluable to software engineering, such as clear communication, adaptability, and mentoring. I've also participated in a number of game jams hosted by NJIT's International Game Developers Association, giving me experience in rapid prototyping and iterating on smaller-scoped projects.

I'm an AWS Certified Cloud Practitioner, with a Foundational C# with Microsoft certification, with experience spanning full-stack development, backend API design, cloud infrastructure, CI/CD, and modern frontend frameworks. I'm comfortable taking ownership of features, collaborating with others, and delivering reliable, well-structured systems.

I'm especially interested in software engineering, backend development, cloud engineering, and building scalable full-stack applications. Explore this portfolio to learn more about my projects and skills. If you'd like to collaborate or discuss an opportunity, feel free to reach out.
